Name: P V Girisidhas
Reg NO: 19722600222

AIM:

To find the average price per location, the number of properties with more than four bedrooms and the largest property.

Software Used:

Python 3, Pandas (Jupyter Notebook).

Algorithm:

1. Create the DataFrame property_data.
2. Groupby location and take the mean listing price.
3. Count rows where bedrooms > 4.
4. Use .idmax() on area to find the largest property
5. Display the results.

CODE:

```
import pandas as pd
property_data = pd.DataFrame ({
    "property_id": [1,2,3,4,5,6,7],
    "location": ["Chennai", "mumbai", "chennai", "Delhi",
                 "mumbai", "Delhi", "chennai"],
    "bedrooms": [3,5,2,4,6,5,4]
    "area_sqft": [1500, 2800, 1000, 2000, 3500, 2600, 1800]
    "listing_price": [7500000, 21000000, 5000000, 18000000]
```

3)

```
print(property_data.groupby("location")["listing-price"].mean())
print(property_data[property_data["bedrooms"] > 4].sum())
print(property_data.loc[property_data["area-sqft"].idxmax()])
```

Input/Output:

Chennai 7166666.67
Delhi 3500000
Mumbai 2550000

3

property-id 5, Mumbai, 6 bedrooms, 3500 sqft, Rs. 3000000

Result:

Mumbai has the highest average price (Rs 2.55 crore).
Three properties have more than four bedrooms.
The largest property is ID 5 in Mumbai (3500 sqft).
